

**METHOD AND SYSTEM FOR ADJUSTING THE RELATIVE VALUE OF
SYSTEM CONFIGURATION RECOMMENDATIONS**

ABSTRACT OF THE DISCLOSURE

[0050] A method and system are provided for proposing advice consisting of corrective actions and enhancements to address a detected problem or measured degradation in the operation of a computer based on collected configuration and performance data. After the advice is proposed, the method and/or system automatically detects when and in what form the advice was implemented, and rates the efficacy of the implementation action based on subsequent collection and measurement of performance. The method and/or system is then able to adjust the importance of the advice relative to other advice.
